Exercise A: User Manual Procedure

How to Create a GitHub Repository and Make a First Commit

Prerequisites

Before starting, you need:

- A GitHub account.
- A computer with internet access.
- Git installed on your computer.
- A folder containing your project files.
- A terminal or command prompt.

Steps

1. Open GitHub.
   Go to GitHub and log in to your account.
   Expected result: Your GitHub home page opens.
2. Create a new repository.
   Click the + button and select New repository.
   Expected result: The new repository page opens.
3. Enter the repository name.
   Type a name for your repository, such as `my-first-project`.
   Expected result: The repository name appears in the name box.
4. Choose the repository type.
   Select Public so other people can view the repository.
   Expected result: The Public option is selected.
5. Create the repository.
   Click Create repository.
   Expected result: Your new repository is created.
6. Open your project folder.
   Open the terminal and go to the folder containing your project.
   Expected result: The terminal is inside your project folder.
7. Start Git in the folder.
   Type:

```
git init
```

8.
9. Expected result: Git creates a repository in your project folder.
10. Add the project files.
    Type:

```
git add .
```

11.
12. Expected result: The files are ready to be committed.
13. Make the first commit.
    Type:

```
git commit -m "Initial commit"
```

14.
15. Expected result: Git creates the first commit.
16. Connect the folder to GitHub.
    Type the following command and replace the username and repository name with your own:

```
git remote add origin
https://github.com/USERNAME/REPOSITORY.git
```

17.
18. Expected result: Your local project is connected to GitHub.
19. Set the main branch.
    Type:

```
git branch -M main
```

20.
21. Expected result: The branch is named `main`.
22. Send the files to GitHub.
    Type:

```
git push -u origin main
```

23.
24. Expected result: Your project files appear in your GitHub repository.

Screenshot

I would include a screenshot of my GitHub repository after the files have been uploaded. The screenshot should show the repository name, the project files, the `main` branch, and the first commit.

Troubleshooting

One common problem is that the computer says “git is not recognized.” This means Git may not be installed. Install Git and restart the terminal. Then type `git --version` to check that Git is working.

Exercise B: API Reference Entry

Create a New Task

Endpoint

POST `/api/v1/projects/{projectId}/tasks`

Description

This endpoint creates a new task in a project. The user must be logged in and have permission to add tasks to the project.

A task must have a title, an assignee, a due date, and a priority. The description is optional.

Path Parameter

Name	Type	Required	Description
`projectId`	string	Yes	The ID of the project where the task will be created.

Request Body

Name	Type	Required	Description
`title`	string	Yes	The name of the task.
`description`	string	No	Extra information about the task.
`assigneeId`	string	Yes	The ID of the user who will do the task.
`dueDate`	string	Yes	The date the task should be completed. Use `YYYY-MM-DD`.

`priority`	string	Yes	The task priority. It can be `low`, `medium`, or `high`.

Required Headers

Header	Required	Description
`Authorization`	Yes	The user's login token. It uses the Bearer format.
`Content-Type`	Yes	Shows that the request data is JSON.

Example Request

```
POST /api/v1/projects/proj_1024/tasks
Authorization: Bearer your_access_token
Content-Type: application/json

{
  "title": "Prepare monthly report",
  "description": "Prepare the report for the logistics team.",
  "assigneeId": "usr_2048",
  "dueDate": "2026-10-15",
  "priority": "high"
}
```

Response Codes

Code	Meaning
`201 Created`	The task was created successfully.
`400 Bad Request`	Some information in the request is missing or incorrect.
`401 Unauthorized`	The user is not logged in or the token is not valid.

`403 Forbidden`	The user does not have permission to create the task.
`404 Not Found`	The project or user cannot be found.
`409 Conflict`	The request conflicts with the current project information.
`422 Unprocessable Entity`	The information was received but one or more values are not valid.
`500 Internal Server Error`	There was a problem on the server.

Successful Response

201 Created

```
{
  "id": "task_7842",
  "projectId": "proj_1024",
  "title": "Prepare monthly report",
  "description": "Prepare the report for the logistics team.",
  "assigneeId": "usr_2048",
  "dueDate": "2026-10-15",
  "priority": "high",
  "status": "open",
  "createdAt": "2026-10-05T10:30:00Z"
}
```

Summary

The endpoint is used to create a new task in a project. The user sends the task information in JSON format. If everything is correct, the server creates the task and returns the new task information.
